Window **safety film**  
for your vehicle

## WHAT IS WINDOW TINTING

Window tinting is the process of increasing the strength and shade of vehicle windows. In other words, it refers to the measure of the percentage of visible light transmitted through the car window.

Window tinting is usually carried out in various shades. Safety film percentages often range from 10% up to 90%, usually in increments of five or 10, but can also reach as low as 5%. Here is what you need to know about the various film percentages.

## WHAT ARE THE DIFFERENT TYPES OF WINDOW TINTING

Anti-smash and grab Clear Tint: This tint is perfect if all you want is the added safety. When in a “smash and grab attack” the film will hold the broken glass in one place and shield you from dangerous flying glass shards and intruding debris, it slows access to the vehicle, which creates more noise and gives you more time to escape.

Anti-smash and grab 50% Tint: Applying a 50% tint to your windows forms little to no darkness and blocks only half the light from reaching the inside of your vehicle. However, it is still excellent for hindering UV rays and heat and increases your vision because you experience less distraction from glares and less strain on your eyes.

Anti-smash and grab 35% Tint: Using a 35% tint creates a darker appearance but still allows you to see through with ease. It gives your car a smooth look with many advantages, this is the most recommended shade.

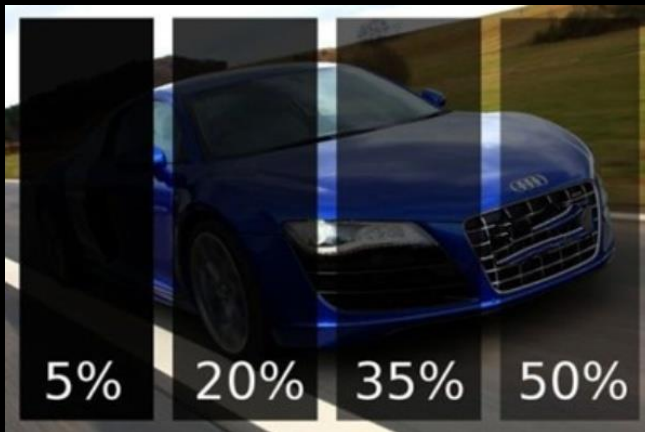

Anti-smash and grab 20% Tint: With 20% tint, you can see through the window up close from an outside view, but it is difficult.

Anti-smash and grab 5% Tint: Applying a 5% tint is the darkest on the market. You will have trouble seeing at night time and is not recommended for front windows. This window tint percentage is illegal for many vehicles, but there are exceptions such as limousines.

The safety film that we install is 100 microns thick and carries a 10-year warranty.

Window tinting shades are not just used to enhance the look of your car, but to also act as a protection from forceful entry and harmful UV rays. Additionally, it will reduce the heat and glare on the vehicle. When choosing the shade, three factors such as the colour of the vehicle, interior colour and the levels of privacy needed, must be taken into consideration.

## THE BENEFITS

- Protection from smash and grab attacks
- Reduce Glare
- Heat Rejection
- Blocks harsh UV rays that can fade upholstery and discolour leather and vinyl.
- Privacy and Security
